ENGELSMANN // NEWS

Dear readers,

There's a lot going on in this issue of "Engelsmann **News**": and as far as our new drum hoop mixer in Hygienic Design is concerned, (nearly) everything revolves around it functioning hygienically. The issue of when "round" is better than „square“ will be explained by our screening technology experts, who will compare the different machine formats. With the new hygienic emptying hopper, too, the shape has a major impact in ensuring that the big bags can be emptied without contamination.

We hope you enjoy reading this and wish you a great summer 2019.

Your Engelsmann team

Sparkling Clean Thanks to Hygienic Design

The **JEL RRM** drum hoop mixer that is so popular among our customers is ready for a change and now looks its best in a shiny new Hygienic Design variation that is ready to impress:

Thanks to the open design, all parts of the new hygienic variant can be accessed easily. Flat surfaces, a design free from dead spaces and the possibility to completely dismantle the mixer make for simple and thorough cleaning. If you would like to see for yourself what makes the new variant of our JEL RRM so good, just look at the new product website dedicated to the classic mixer.

Round Vibrating Screens: All-Rounders with Special Features

At this year's Powtech, the new **JEL VibRS** round vibration screening machine made its first public appearance and, in terms of popularity, fit in perfectly with Engelsmann's (mostly rectangular) range of screening technology.

But where, then, do we see concrete differences between the round and rectangular machines when using the screens? How do round screening machines perform in terms of hygiene, flexibility and compatibility?

Our screening technology experts can tell you when the round version is the best bet with a direct comparison.

NEW: Hygienic Big Bag Emptying with the Right Hopper

The emptying hopper makes the biggest difference to whether or not the big bag is emptied hygienically. As an emptying hopper is the only part of an emptying station with direct product contact, the risk of contamination is greatest at this stage, for example, through spoiled product residue.

Therefore, simple and thorough cleaning was a must when developing our new hygienic emptying hopper that could be completely dismantled in a few steps to disinfect all the individual parts.

You can find out more about the new hygienic big bag emptying hopper and other hygiene features with a click.
