ENGELSMANN
// AKTUELL

The banner features the text 'ENGELSMANN' in white and '// AKTUELL' in white with a red double-slash. The background is a dark, abstract image with blue and red particle-like effects.

Dear readers,

For all bulk solids experts, there is a special event just round the corner: SCHÜTTGUT 2017 will take place on 10 and 11 May in Dortmund. Engelsmann will be using this event as a platform to present a new development in the field of screening technology. In today's trade fair issue, you will learn what makes the new **JEL Phoenix** screening machine so special and how you can get free tickets to make sure you don't miss its premiere.

We hope you enjoy reading.

Your Engelsmann team

JEL Phoenix - Screening Without Compromise

With the JEL Phoenix, Engelsmann has developed a new long-stroke screening machine which provides more flexibility and efficiency for use in the chemical industry. It combines a screening process which is particularly gentle on the product with high screening precision and maximum versatility. The heart is a modular sieve cartridge system: by stacking up to 4 screen decks, separation into up to 5 groups is possible using just one machine. Also a variety of screening applications, such as protective and classification screening can be realised within one screening process. More detailed information about the JEL Phoenix is just a click away.

JEL Phoenix in Practice

The new Engelsmann sieve JEL Phoenix was especially developed for applications in the chemical industry and can be used for a multitude of products and screening tasks. The screening machine is particularly aimed at applications in which the system operator is confronted with changing tasks such as varying products, screening applications and/or fluctuating production volumes.

The first practical experience in the production of catalysts and various detergent formulas provides an impressive demonstration of the possibilities which the JEL Phoenix offers for adaptation to different framework conditions.
